A CLOSED SEPARABLE SUBSPACE NOT BEING A RETRACT OF $\beta\mathbb{N}$

Petr Simon (Mathematical Institute of Charles University, Sokolovská 83, 18600 Praha, Czechoslovakia), oblatum 17.4. 1984.

D. Maharam [M] proved that the following are equivalent:

- (a) For each ideal $I \in \mathcal{P}(\mathbb{N})$, if there is a one-to-one homomorphism from $\mathcal{P}(\mathbb{N})/I$ to $\mathcal{P}(\mathbb{N})$, then there is a lifting from $\mathcal{P}(\mathbb{N})/I$ to $\mathcal{P}(\mathbb{N})$, too;
 (b) every non-void closed separable subspace of $\beta\mathbb{N}$ is a retract of $\beta\mathbb{N}$, and has raised the question, whether (a) or (b) is a true statement.

The answer to the Maharam's problem is in negative. We can prove the two theorems below.

Theorem 1. There exists a subspace $X \subseteq \beta\mathbb{N} - \mathbb{N}$ satisfying the following:

(1) $X = \bigcup_{n \in \omega} X_n$, where $|X_n| = 1$ and for each $n \in \omega$, the set X_n is countable discrete;

(2) for each $n < m < \omega$, $X_n \subseteq \overline{X_m} - X_m$;

(3) for each $n < \omega$ and for each $x \in X_n$, x is a ϕ -OK point in $\overline{X_{n+1}} - X_{n+1}$;

(4) suppose $\{U_k : k \in \omega\} \subseteq \mathcal{P}(\mathbb{N})$ to be a family of sets such that for some $n_0 < \omega$, $U_0^* \cap X_{n_0}$ is finite and for each $i < k < \omega$, $U_i^* \cap X_{n_0+i} \subseteq U_k^*$. Then there is a family $\{V_\alpha : \alpha \in \phi\} \subseteq \mathcal{P}(\mathbb{N})$ such that for each $\alpha \in \phi$, $V_\alpha^* \supseteq X \cap \bigcap_{k \in \omega} U_k^*$ and for each $k < \omega$ and for each finite set $\alpha_0 < \alpha_1 < \dots < \alpha_k < \phi$, $\bigcap_{i=0}^k V_{\alpha_i}^* \subseteq \bigcap_{i=0}^k U_i^*$;

(5) for each mapping $f: \mathbb{N} \rightarrow X$ there is a set $T \subseteq \mathbb{N}$ and an integer $n_1 < \omega$ such that $T^* \cap X \neq \emptyset$ and for each $n > n_1$, $X_n \cap f[T] \cap X_{n+1} = \emptyset$.

Theorem 2. If a subspace $X \subseteq \beta\mathbb{N}$ satisfies (1) - (5) from Theorem 1, then X is not a retract of $\beta\mathbb{N}$.

It should be noted that the first example of a closed separable subspace of $\beta\mathbb{N}$ which is not a retract of $\beta\mathbb{N}$ was given by M. Talagrand under CH in [T] and the second one by A. Szymanski under MA in [S].

SHORT BRANCHES IN RUDIN-FROLÍK ORDER

Eva Butkovičová (MÚ SAV, Jesenná 5, 04154 Košice, Československo), oblatum 27.4. 1984.

Rudin-Frolík order of types of ultrafilters in $\beta\mathbb{N}$ has the following properties:

(1) each type of ultrafilters has at most 2^{k_0} predecessors, [2],

(2) the cardinality of each branch is at least 2^{k_0} . Thus, in Rudin-Frolík order the cardinality of branches can be only 2^{k_0} or $(2^{k_0})^+$. It was shown in [1] that there exists a chain order - isomorphic to $(2^{k_0})^+$. Hence, the existence of a branch of cardinality $(2^{k_0})^+$ is proved.

The following result solves the problem of the existence of a branch having smaller cardinality.

Theorem. In Rudin-Frolík order there exists an unbounded chain order-isomorphic to ω_1 .

By the properties (1) and (2) the branch containing this chain has cardinality 2^{k_0} .

RESULTS ON DISJOINT COVERING SYSTEMS ON THE RING OF INTEGERS

Ivan Korec, Department of Algebra, Faculty of Mathematics and Physics of Comenius University, 84215 Bratislava, Czechoslovakia oblatum 12.4. 1984.

A system of congruence classes
 (1) $a_1(\text{mod } n_1), a_2(\text{mod } n_2), \dots, a_k(\text{mod } n_k)$
 will be called a disjoint covering system (DCS) if for every integer x there is exactly one $i \in \{1, 2, \dots, k\}$ such that $x \equiv a_i(\text{mod } n_i)$. The integers n_1, n_2, \dots, n_k will be called moduli of (1) and their least common multiple will be called the common modulus of (1).

If $k > 1$ then no two moduli of (1) are relatively prime. This condition can be expressed in the form

$$(2) \quad \bigwedge_{i=1}^k \bigwedge_{j=1}^k \varphi(n_i, n_j)$$

where $\varphi(x, y)$ is the formula

$$\exists z \exists u \exists v (z \neq 1 \wedge z.u = x \wedge z.v = y)$$

Consider more generally the formulae of the form
