l_∞ -NORM OF ITERATES AND THE SPECTRAL RADIUS OF MATRICES

ZDENĚK DOSTÁL, Ostrava

(Received October 18, 1977)

Let B be a finite dimensional Banach space. Let $L(B)$ denote the algebra of all linear operators on B and let the operator norm and the spectral radius of $A \in L(B)$ be denoted by $|A|$ and $|A|_\sigma$, respectively.

If $A \in L(B)$ and $|A| = 1$, then the spectral radius formula suggests the conjecture that for some natural number m , nontrivial bounds for $|A^m|$ in terms of $|A|_\sigma$ and vice versa may be given.

The first positive result of the kind was presented by V. PTÁK and J. MAŘÍK [1], who have computed the critical exponent of the l_∞ -space. If we denote the complex n -dimensional vector space by $B_{n,\infty}$, the norm $|x|_\infty$ of the vector $x = (x_1, \dots, x_n)$ being defined by the formula

$$|x|_\infty = \max_{i=1, \dots, n} |x_i|,$$

then their theorem says that the spectral radius of $A \in L(B_{n,\infty})$, $|A|_\infty = |A^{n^2-n+1}|_\infty = 1$, is equal to one.

Later, V. Pták [2] introduced for $0 < r < 1$ the quantity

$$C(B, r, m) = \sup \{|A^m| : A \in L(B), |A| \leq 1, |A|_\sigma \leq r\}$$

and found, for an n -dimensional Hilbert space H_n , a certain operator $A \in L(H_n)$ such that $|A| = 1$, $|A|_\sigma = r$ and $|A^n| = C(H_n, r, n)$. Recently, the present author [3] has proved that this extremal operator is unique up to multiplication by a complex unit and similarity by a unitary mapping. For further references see [2].

The purpose of this note was originally to find the extremal operators in $L(B_{n,\infty})$. We have not succeeded in general, nevertheless, we have found for each r , $0 \leq r \leq 2^{1/n} - 1$, an operator $A \in L(B_{n,\infty})$ such that $|A|_\infty = 1$, $|A|_\sigma = r$ and $|A^m|_\infty = C(B_{n,\infty}, r, m)$ for all natural m .

Let n be a fixed natural number and let M_n denote the algebra of all $n \times n$ complex valued matrices.

Regarding a matrix $A = (a_{ij})$ as an operator on $B_{n,\infty}$, we can write

$$|A|_\infty = \max_i \sum_{j=1}^n |a_{ij}|.$$

Let $\alpha_1, \dots, \alpha_n$ be given complex numbers. Consider the recursive relation

$$(1) \quad x_{k+n} = \alpha_1 x_k + \dots + \alpha_n x_{k+n-1}.$$

For each i , $1 \leq i \leq n$, we denote by $w_i(\alpha_1, \dots, \alpha_n)$ the solution $(w_{i0}, w_{i1}, w_{i2}, \dots)$ of this relation with initial conditions

$$(2) \quad w_{ik}(\alpha_1, \dots, \alpha_n) = \delta_{i,k+1}, \quad 0 \leq k \leq n-1.$$

In the following lemma we shall learn the meaning of w_{ik} :

Lemma 1. Let $A \in M_n$ and

$$(3) \quad A^n = \alpha_1 E + \alpha_2 A + \dots + \alpha_n A^{n-1}.$$

Then for all $k \geq 0$,

$$(4) \quad A^k = w_{1k} E + w_{2k} A + \dots + w_{nk} A^{n-1}.$$

Proof. The statement is obvious for $k \leq n$. To prove the lemma for $k > n$ by induction, suppose that $s > n$ and that (4) holds for $k = 0, 1, \dots, s-1$. Put $q = s - n$. If we multiply (3) by A^q and use the induction hypothesis, we successively get

$$\begin{aligned} A^s &= \sum_{i=1}^n \alpha_i A^{q+i-1} = \sum_{i=1}^n \alpha_i \sum_{j=1}^n w_{j,q+i-1} A^{j-1} = \\ &= \sum_{j=1}^n \left(\sum_{i=1}^n \alpha_i w_{j,q+i-1} \right) A^{j-1} = \sum_{j=1}^n w_{js} A^{j-1}. \end{aligned}$$

Let us denote now the companion matrix of the equation

$$(5) \quad x^n = \alpha_1 + \alpha_2 x + \dots + \alpha_n x^{n-1}$$

by $T(\alpha_1, \dots, \alpha_n)$, that is

$$T = \begin{bmatrix} 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \cdot & \cdot & \cdot & \dots & \cdot \\ 0 & 0 & 0 & \dots & 1 \\ \alpha_1 & \alpha_2 & \alpha_3 & \dots & \alpha_n \end{bmatrix},$$

and observe that (5) is the characteristic equation of T . Thus by Cayley-Hamilton's theorem T satisfies the assumptions of Lemma 1 and we can write for each $k = 0, 1, 2, \dots$

$$(6) \quad T^k = w_{1k} E + w_{2k} T + \dots + w_{nk} T^{n-1}.$$

This equation enables us to solve the special maximum problem:

Lemma 2. Let $A \in M_n$, $|A|_\infty \leq 1$. If the characteristic equation (5) of the matrix A fulfils

$$(7) \quad \sum_{i=1}^n |\alpha_i| \leq 1,$$

then for all $k \geq 0$,

$$|A^k|_\infty \leq T(\alpha_1, \dots, \alpha_n)^k = \sum_{i=1}^n |w_{ik}|.$$

Proof. We may apply Lemma 1 to get

$$|A^k|_\infty = \left| \sum_{i=1}^n w_{ik} A^{i-1} \right|_\infty \leq \sum_{i=1}^n |w_{ik}| |A^{i-1}|_\infty \leq \sum_{i=1}^n |w_{ik}|$$

for each A under the assumptions. Note that, in particular, T satisfies the assumptions. The first row of T^k being $(w_{1k}, w_{2k}, \dots, w_{nk})$ (see (6)), we get

$$|T^k|_\infty = \sum_{i=1}^n |w_{ik}|.$$

Now we shall denote, for $1 \leq i \leq n$, by E_i the polynomial

$$(8) \quad E_i(x_1, \dots, x_n) = \sum_{\substack{e_j \in \{0,1\} \\ e_1 + \dots + e_n = i}} x_1^{e_1} x_2^{e_2} \dots x_n^{e_n}.$$

For any complex numbers $\varrho_1, \dots, \varrho_n$ and $i = 1, 2, \dots, n$, we put

$$\alpha_i(\varrho_1, \dots, \varrho_n) = (-1)^{n-i} E_{n-i+1}(\varrho_1, \dots, \varrho_n),$$

so that the roots of the equation (5) with coefficients $\alpha_i = \alpha_i(\varrho_1, \dots, \varrho_n)$ are exactly $\varrho_1, \dots, \varrho_n$.

Let us compute an upper bound for such r 's that $|\varrho_i| \leq r$ implies

$$(9) \quad \sum_{i=1}^n |\alpha_i(\varrho_1, \dots, \varrho_n)| \leq 1.$$

Lemma 3. Let $\varrho_1, \dots, \varrho_n$ be any complex numbers. If $|\varrho_i| \leq 2^{1/n} - 1$ for all $i = 1, \dots, n$, then the inequality (9) holds true.

Proof. Let $0 < r < 1$ and note that

$$\alpha_i(r, r, \dots, r) = (-1)^{n-i} \binom{n}{n-i+1} r^{n-i+1},$$

$i = 1, \dots, n$. If $|\varrho_i| \leq r$ holds for all $i = 1, \dots, n$, then $|\alpha_i(\varrho_1, \dots, \varrho_n)| \leq |\alpha_i(r, r, \dots, r)|$. Thus the supremum r_0 of the set of all r 's we are interested in is the only positive root of the equation

$$1 - \sum_{i=1}^n \binom{n}{i} x^i = 0.$$

Easy computation shows that $r_0 = 2^{1/n} - 1$.

To compute $C(B_{n,\infty}, r, k)$ for $r \leq 2^{1/n} - 1$ and given k , it is enough to find

$$\max_{|e_1| \leq r, \dots, |e_n| \leq r} \sum_{i=1}^n |w_{ik}(e_1, \dots, e_n)|.$$

The fact that the maximum is attained for all natural k if $q_i = r$ is an easy consequence of the following lemma, which was proved by V. KNICHAL ([2], Lemma 7).

Lemma 4. For each $i = 1, 2, \dots, n$ and each $k \geq n$,

$$w_{ik}(e_1, \dots, e_n) = \varepsilon_i Q_{ik}(e_1, \dots, e_n),$$

where $\varepsilon_i = (-1)^{n-i}$ and

$$Q_{ik}(e_1, \dots, e_n) = \sum_{\substack{e_j \geq 0 \\ e_1 + \dots + e_n = k-i+1}} c_{ik}(e_1, \dots, e_n) e_1^{e_1} \dots e_n^{e_n},$$

where all $c_{ik}(e_1, \dots, e_n) \geq 0$.

The point of the lemma is that for $k \geq n$ and i fixed, all the coefficients of w_{ik} are of the same sign. Thus if $|e_i| \leq r$ for $i = 1, \dots, n$, then

$$\begin{aligned} |w_{ik}(e_1, \dots, e_n)| &= |Q_{ik}(e_1, \dots, e_n)| \leq \\ &\leq |Q_{ik}(r, \dots, r)| = |w_{ik}(r, \dots, r)|, \quad i = 1, \dots, n. \end{aligned}$$

We can sum up our results into the following theorem:

Theorem 1. Let $0 < r \leq 2^{1/n} - 1$, let

$$\alpha_i = (-1)^{n-i} \binom{n}{n-i+1} r^{n-i+1}$$

for $i = 1, \dots, n$ and let

$$T = \begin{bmatrix} 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \cdot & \cdot & \cdot & \dots & \cdot \\ 0 & 0 & 0 & \dots & 1 \\ \alpha_1 & \alpha_2 & \alpha_3 & \dots & \alpha_n \end{bmatrix}.$$

Then $|T|_\infty = 1$, $|T|_\sigma = r$ and for each natural k ,

$$|T^k|_\infty = \sum_{i=1}^n |w_{ik}| = C(B_{n,\infty}, r, k),$$

where w_{ik} are the solutions of the recurrent relation

$$x_{s+n} = \alpha_1 x_s + \alpha_2 x_{s+1} + \dots + \alpha_n x_{s+n-1}$$

with initial conditions $w_{ij} = \delta_{i,j+1}$, $i = 1, \dots, n$, $j = 0, 1, \dots, n-1$.

We close the paper by two simple corollaries of Theorem 1.

Corollary 1. Let $0 \leq r < 1$. Then $C(B_{n,\infty}, r, n) = \min \{1, (1+r)^n - 1\}$.

Proof. Note that $w_{in} = \alpha_i$ for $i = 1, \dots, n$ and apply Theorem 1.

Corollary 2. Let $0 < s \leq 1$. If $A \in L(B_{n,\infty})$, $|A|_\infty \leq 1$ and $|A^n|_\infty = s$, then $|A|_\sigma \geq (1+s)^{1/n} - 1$.

Proof. If $|A|_\sigma = r < (1+s)^{1/n} - 1$, then

$$|A^n|_\infty \leq C(B_{n,\infty}, r, n) \leq (1+r)^n - 1 < s.$$

This study was suggested by V. Pták, to whom I wish to express here my thanks.
