TABLES OF THE BRILLOUIN FUNCTION

L. VALENTA and Š. ZAJAC

Department of Theoretical Physics, Faculty of Mathematics and Physics, Charles University, Prague

(Received 27 May 1970)

The Brillouin function  $B_J(x)$  is tabulated for  $J = n \frac{1}{2}$  ( $n = 1, 2, \dots, 20; \infty$ ).

The origin of these tables was stimulated by the need of the authors of sufficiently comprehensive tables of the Brillouin function

$$B_J(x) = \frac{2J+1}{2J} \coth \frac{2J+1}{2J} x - \frac{1}{2J} \coth \frac{x}{2J}$$

when calculating the spontaneous magnetization of thin films and other magnetic materials.

Nevertheless, such tables are useful not only in ferromagnetism, but also for analogous problems in ferroelectricity, in the theory of electric and magnetic susceptibilities, in the theory of order-disorder phenomena, magnetochemistry etc.

Since there was a lack of numerically evaluated data of  $B_J(x)$  (despite of some partial results of insufficient extent (see e.g. /1/, /2/) for what is frequently needed) and only a few numerical data and graphs may be found dispersed in literature (see e.g. /3/, /4/), the authors decided in 1965 to evaluate  $B_J(x)$  for  $J = n \frac{1}{2}$  ( $n = 1, 2, \dots, 20; \infty$ ) for sufficiently small intervals of  $x$  and a sufficient number of decimal places.

The calculations have been performed by the computer URAL II with the accuracy of eight places. The results have been rounded to five decimal places for practical use.

To get some more insight in the dependence on  $x$  for a wide range of  $x$  the results have been plotted graphically and some of them added to the tables presented in this work.

In practice, mostly the values of  $J = n \frac{1}{2}$  for  $n = 1, 2, \dots, 7$  and  $\infty$  are needed. Therefore, a more dense selection of values for  $B_J(x)$  has been realized for those  $J$ 's and the values of  $B_J(x)$  for  $J$  from  $J = 4$  to  $J = 10$  are presented for a reduced selection of the argument  $x$ .

In these tables the mostly used name of "Brillouin function" has been used for  $B_J(x)$ . Nevertheless, let us remark that other names, namely the "Langevin function" ( $L_{1/2}(x)$ ,  $L_1(x)$ , ...  $L(x)$ ) or the "Generalized Langevin function" or the "Brillouin-Debye" function are used.

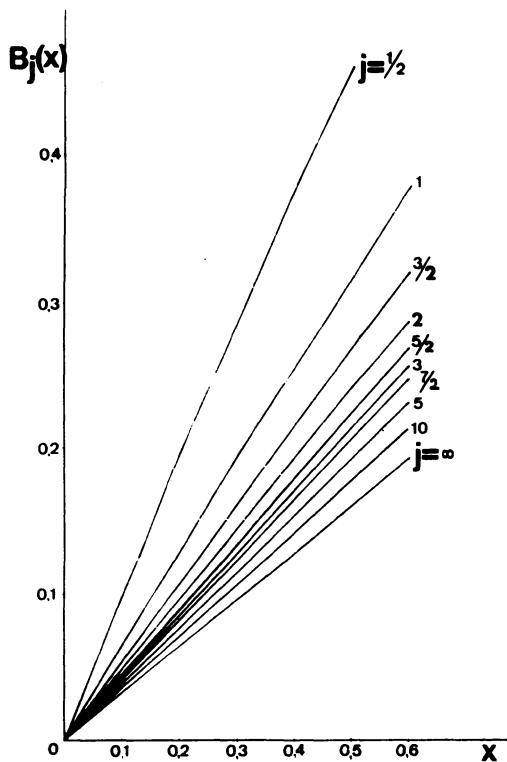

Fig. 1.

The tables which were finished in autumn 1965, were originally destined for the use in the authors' research work and were given only at the disposal of some research fellows of the authors from other laboratories.

In the time between the completion of our tables and their edition some further numerical data on  $B_J(x)$  have been published by J.S. Smart /5/ and M.I. Darby /6/. The comparison of those tables with ours, similarly as the comparison with the table of  $B_\infty(x)$  in /2/ shows that our tables remain still the most complete ones as to the density of  $x$ 's and the range of  $J$ 's. Moreover, our work contains some graphs for  $B_J(x)$  which are not to be found in the

papers and books mentioned above. This is one of other reasons why we decided to publish our tables.

Comparing our values of  $B_J(x)$  for  $x$ 's with these which may be found in the tables of other authors we have found no differences.

The authors would like to thank Ing. J. Čulík, member of the Mathematical Laboratory of the Czech Technical University, Prague, for help during the computations.
