PAIRS OF SQUARE-FREE VALUES OF THE TYPE $n^2 + 1$, $n^2 + 2$

STOYAN DIMITROV, Sofia

Received April 26, 2020. Published online June 17, 2021.

Cordially dedicated to Professor Ivan Trendafilov on the occasion of his 71th birthday

Abstract. We show that there exist infinitely many consecutive square-free numbers of the form $n^2 + 1$, $n^2 + 2$. We also establish an asymptotic formula for the number of such square-free pairs when n does not exceed given sufficiently large positive number.

Keywords: square-free number; asymptotic formula; Kloosterman sum

MSC 2020: 11L05, 11N25, 11N37

1. NOTATIONS

Let X be a sufficiently large positive number. By ε we denote an arbitrary small positive number, not necessarily the same, in different occurrences. As usual, $\mu(n)$ is Möbius' function and $\tau(n)$ denotes the number of positive divisors of n. Further, [t] and $\{t\}$ denote the integer part and the fractional part of t, respectively. We shall use the convention that a congruence $m \equiv n \pmod{d}$ will be written as $m \equiv n(d)$. As usual, (m,n) is the greatest common divisor of m and n. The letter p will always denote prime number. We put

(1.1)
$$\psi(t) = \{t\} - \frac{1}{2}.$$

Moreover $e(t) = \exp(2\pi i t)$. For $x, y \in \mathbb{R}$ we write $x \equiv y(1)$ when $x - y \in \mathbb{Z}$. For any n and q such that (n, q) = 1 we denote by \bar{n}_q the inverse of n modulo q. The number of distinct prime factors of a natural number n we denote by $\omega(n)$. For any odd prime number p we denote by $\left(\frac{\cdot}{p}\right)$ the Legendre symbol. By K(r, h) we shall

DOI: 10.21136/CMJ.2021.0165-20

denote the incomplete Kloosterman sum

(1.2)
$$K(r,h) = \sum_{\substack{\alpha \leqslant x \leqslant \beta \\ (x,r)=1}} e\left(\frac{h\bar{x}_{|r|}}{r}\right),$$

where

$$h, r \in \mathbb{Z}, \quad hr \neq 0, \quad 0 < \beta - \alpha \leq 2|r|.$$

2. Introduction and statement of the result

In 1931 Estermann in [6] proved that there exist infinitely many square-free numbers of the form $n^2 + 1$. More precisely, he proved that for $X \ge 2$ the asymptotic formula

$$\sum_{n \le X} \mu^2(n^2 + 1) = c_0 X + \mathcal{O}(X^{2/3} \log X)$$

holds. Here

$$c_0 = \prod_{p \equiv 1(4)} \left(1 - \frac{2}{p^2}\right).$$

Afterwards, Heath-Brown in [8] used a variant of the determinant method and improved the remainder term in the formula of Estermann with $\mathcal{O}(X^{7/12+\varepsilon})$.

On the other hand, in 1932 Carlitz in [1] showed that there exist infinitely many pairs of consecutive square-free numbers. More precisely, he proved the asymptotic formula

(2.1)
$$\sum_{n \le X} \mu^{2}(n)\mu^{2}(n+1) = \prod_{p} \left(1 - \frac{2}{p^{2}}\right)X + \mathcal{O}(X^{\theta + \varepsilon}),$$

where $\theta=2/3$. Formula (2.1) was sharpened by Heath-Brown (see [7]) to $\theta=\frac{7}{11}$ and by Reuss (see [10]) to $\theta=\frac{1}{81}(26+\sqrt{433})$.

The existence of infinitely many consecutive square-free numbers of a special form was demonstrated by the author in [2], [3], [4], [5]. In particular, in [5] he proved that there exist infinitely many consecutive square-free numbers of the form $x^2 + y^2 + 1$, $x^2 + y^2 + 2$. While in [5] the main role was played by the properties of Gauss sums, in this paper we use a surjective correspondence between the number of representations of numbers by binary quadratic form and the incongruent solutions of quadratic congruence.

Define

(2.2)
$$\Gamma(X) = \sum_{1 \le n \le X} \mu^2 (n^2 + 1) \mu^2 (n^2 + 2),$$

(2.3)
$$S(q_1, q_2) = \{ n \in \mathbb{N} : 1 \le n \le q_1 q_2, n^2 + 1 \equiv 0(q_1), n^2 + 2 \equiv 0(q_2) \}$$

and

(2.4)
$$\lambda(q_1, q_2) = \sum_{n \in S(q_1, q_2)} 1.$$

We establish our result by combining the tasks of Estermann and Carlitz. Thus, we prove the following theorem.

Theorem 2.1. For the sum $\Gamma(X)$ defined by (2.2), the asymptotic formula

(2.5)
$$\Gamma(X) = \sigma X + \mathcal{O}(X^{8/9 + \varepsilon})$$

holds. Here

(2.6)
$$\sigma = \prod_{p>2} \left(1 - \frac{(-1/p) + (-2/p) + 2}{p^2}\right).$$

From Theorem 2.1 it follows that there exist infinitely many consecutive square-free numbers of the form $n^2 + 1$, $n^2 + 2$, where n runs over naturals.

3. Lemmas

The first lemma we need gives us important expansions.

Lemma 3.1. For any $M \geqslant 2$ we have

$$\psi(t) = -\sum_{1 \leqslant |m| \leqslant M} \frac{e(mt)}{2\pi i m} + \mathcal{O}(f_M(t)),$$

where $f_M(t)$ is a positive function of t which is infinitely many times differentiable and periodic with period 1. It can be expanded into the Fourier series

$$f_M(t) = \sum_{m = -\infty}^{\infty} b_M(m)e(mt)$$

with coefficients $b_M(m)$ such that

$$b_M(m) \ll \frac{\log M}{M} \quad \forall m$$

and

$$\sum_{|m|>M^{1+\varepsilon}} |b_M(m)| \ll M^{-A}.$$

Here A > 0 is arbitrarily large and the constant in the \ll symbol depends on A and ε .

The next lemma we need is well-known.

Lemma 3.2. Let $A, B \in \mathbb{Z} \setminus \{0\}$ and (A, B) = 1. Then

$$\frac{\bar{A}_{|B|}}{B} + \frac{\overline{B}_{|A|}}{A} \equiv \frac{1}{AB}(1).$$

Proof. See [12], Lemma 17.5.1.

Lemma 3.3. For the sum denoted by (1.2) the estimate

$$K(r,h) \ll |r|^{1/2+\varepsilon} (r,h)^{1/2}$$

holds.

Proof. Follows easily from Weil's estimate for the Kloosterman sum. See [9], Chapter 11, Corollary 11.12. \Box

Lemma 3.4. Let $n \ge 5$. There exists a surjective function from the solution set of the equation

(3.1)
$$x^2 + 2y^2 = n, \quad (x, y) = 1, \quad x \in \mathbb{N}, \quad y \in \mathbb{Z} \setminus \{0\}$$

to the incongruent solutions modulo n of the congruence

(3.2)
$$z^2 + 2 \equiv 0(n).$$

Proof. Let F denote the set of ordered pairs (x, y) satisfying (3.1) and E denote the set of solutions of the congruence (3.2). We consider each residue class modulo n with representatives satisfying (3.2) as one solution of (3.2).

Let $(x,y) \in F$. From (3.1) it follows that (n,y) = 1. Therefore, there exists a unique residue class z modulo n such that

$$(3.3) zy \equiv x(n).$$

For this class we have

$$(z^2 + 2)y^2 \equiv (zy)^2 + 2y^2 \equiv x^2 + 2y^2 \equiv 0(n).$$

From the last congruence and (n, y) = 1 we deduce $z^2 + 2 \equiv 0(n)$ which means that $z \in E$. We define the map

$$\beta \colon F \to E$$

that associates to each pair $(x, y) \in F$ the residue class $z = x\overline{y}_n$ satisfying (3.3).

We shall prove that the map (3.4) is a surjection. Let $z \in E$. From Dirichlet's approximation theorem it follows that there exist integers a and q such that

(3.5)
$$\left| \frac{z}{n} - \frac{a}{q} \right| < \frac{1}{q\sqrt{n}}, \quad 1 \leqslant q \leqslant \sqrt{n}, \quad (a, q) = 1.$$

Replace

$$(3.6) r = zq - an.$$

Hence

(3.7)
$$r^2 + 2q^2 = z^2q^2 - 2zqan + a^2n^2 + 2q^2 \equiv (z^2 + 2)q^2(n).$$

From (3.2) and (3.7) it follows

(3.8)
$$r^2 + 2q^2 \equiv 0(n).$$

By (3.5) and (3.6) we deduce

$$(3.9) |r| < \sqrt{n}.$$

Using (3.5) and (3.9) we obtain

$$(3.10) 0 < r^2 + 2q^2 < 3n.$$

Bearing in mind (3.8) and (3.10) we conclude that $r^2 + 2q^2 = n$ or $r^2 + 2q^2 = 2n$. Consider two cases.

Case 1:

$$(3.11) r^2 + 2q^2 = n.$$

From (3.6) and (3.11) we get

$$n = (zq - an)^2 + 2q^2 = (zq - an)zq - (zq - an)an + 2q^2 = (zq - an)zq - ran + 2q^2$$

and therefore

$$(3.12) ra + 1 = kq,$$

where

(3.13)
$$k = \frac{z^2 + 2}{n}q - az.$$

By (3.2) and (3.13) it follows that $k \in \mathbb{Z}$ and taking into account (3.12) we deduce

$$(3.14) (r,q) = 1.$$

Using (3.11), (3.14) and $n \ge 5$ we establish that $r \ne 0$.

Consider first r > 0. Replace

$$(3.15) x = r, \quad y = q.$$

From (3.11), (3.14) and (3.15) it follows that $(x, y) \in F$. Also (3.6) and (3.15) give us (3.3). Consequently $\beta(x, y) = z$.

Next we consider r < 0. Put

$$(3.16) x = -r, y = -q.$$

Again (3.11), (3.14) and (3.16) lead to $(x, y) \in F$. As well from (3.6) and (3.16) follows (3.3). Therefore $\beta(x, y) = z$.

Case 2:

$$(3.17) r^2 + 2q^2 = 2n.$$

From (3.6) and (3.17) we find

$$2n = (zq - an)^2 + 2q^2 = (zq - an)zq - (zq - an)an + 2q^2 = (zq - an)zq - ran + 2q^2$$

996

and thus

$$(3.18) ra + 2 = kq,$$

where k is defined by (3.13). From (3.18) we conclude

$$(3.19) (r,q) \leqslant 2.$$

By (3.17), (3.19) and $n \ge 5$ we deduce that $r \ne 0$.

On the other hand, from (3.17) it follows that r is even. We replace $r=2r_0$ in (3.17) and obtain

$$(3.20) q^2 + 2r_0^2 = n.$$

We shall verify that

$$(3.21) (r_0, q) = 1.$$

If we assume that $(r_0, q) > 1$, then (3.19) gives us

$$(3.22) (r_0, q) = 2.$$

From (3.20) and (3.22) it follows

$$(3.23) n \equiv 0(4).$$

Finally (3.2) and (3.23) imply

$$z^2 + 2 \equiv 0(4)$$
.

which is impossible. This proves (3.21).

No matter whether r is positive or negative we replace

$$(3.24) x = q, y = -r_0.$$

Using (3.20), (3.21) and (3.24) we deduce that $(x, y) \in F$. By (3.6) and (3.24) we get

$$(3.25) 2(zy-x) = -2(zr_0+q) = -zr - 2q = -(z^2+2)q + zan.$$

From (3.2) and (3.25) we conclude

$$(3.26) 2(zy-x) \equiv 0(n).$$

If n is odd, then (3.26) gives us (3.3). Consequently $\beta(x,y)=z$.

Let n be even. Since (3.23) is impossible,

(3.27)
$$n = 2n_0, n_0 \text{ is odd.}$$

By (3.20) and (3.27) it follows

$$(3.28) q \equiv 0(2),$$

i.e., q is even.

On the other hand, (3.2) and (3.27) imply that

$$(3.29) z \equiv 0(2),$$

i.e., z is even.

Now (3.24), (3.28) and (3.29) give us

$$(3.30) zy - x \equiv 0(2),$$

i.e., zy - x is even.

Finally from (3.26), (3.27) and (3.30) we obtain (3.3). Therefore $\beta(x,y)=z$. The lemma is proved.

4. Proof of the theorem

Using (2.2) and the well-known identity $\mu^2(n) = \sum_{d^2|n} \mu(d)$ we get

(4.1)
$$\Gamma(X) = \sum_{\substack{d_1, d_2 \\ (d_1, d_2) = 1}} \mu(d_1)\mu(d_2) \sum_{\substack{1 \leqslant n \leqslant X \\ n^2 + 1 \equiv 0(d_1^2) \\ n^2 + 2 \equiv 0(d_2^2)}} 1 = \Gamma_1(X) + \Gamma_2(X),$$

where

(4.2)
$$\Gamma_1(X) = \sum_{\substack{d_1 d_2 \leqslant z \\ (d_1, d_2) = 1}} \mu(d_1)\mu(d_2)\Sigma(X, d_1^2, d_2^2),$$

(4.3)
$$\Gamma_{2}(X) = \sum_{\substack{d_{1}d_{2} > z \\ (d_{1},d_{2}) = 1}} \mu(d_{1})\mu(d_{2})\Sigma(X, d_{1}^{2}, d_{2}^{2}),$$

$$\Sigma(X, d_{1}^{2}, d_{2}^{2}) = \sum_{\substack{1 \leq n \leq X \\ n^{2} + 1 \equiv 0(d_{1}^{2}) \\ n^{2} + 2 \equiv 0(d_{2}^{2})}} 1,$$

(4.4)
$$\Sigma(X, d_1^2, d_2^2) = \sum_{\substack{1 \leqslant n \leqslant X \\ n^2 + 1 \equiv 0(d_1^2) \\ n^2 + 2 \equiv 0(d_2^2)}} 1,$$

$$(4.5) \sqrt{X} \leqslant z < X,$$

where z is to be chosen later.

4.1. Estimation of $\Gamma_1(X)$. Suppose that $q_1 = d_1^2$, $q_2 = d_2^2$, where d_1 and d_2 are square-free, $(q_1, q_2) = 1$ and $d_1 d_2 \leq z$.

Denote

(4.6)
$$\Omega(X, q_1, q_2, n) = \sum_{\substack{m \leqslant X \\ m \equiv n(q_1 q_2)}} 1.$$

Using (2.3), (4.4) and (4.6) we obtain upon partitioning sum (4.4) into residue classes modulo q_1q_2

(4.7)
$$\Sigma(X, q_1, q_2) = \sum_{n \in S(q_1, q_2)} \Omega(X, q_1, q_2, n).$$

It is easy to see that

(4.8)
$$\Omega(X, q_1, q_2, n) = \frac{X}{q_1 q_2} + \mathcal{O}(1).$$

From (2.4), (4.7) and (4.8) we find

(4.9)
$$\Sigma(X, q_1, q_2) = X \frac{\lambda(q_1, q_2)}{q_1 q_2} + \mathcal{O}(\lambda(q_1, q_2)).$$

Taking into account (2.3), (2.4), Chinese remainder theorem and that the number of solutions of the congruence $n^2 \equiv a(q_1q_2)$ is less than or equal to $\tau(q_1q_2)$, we get

$$(4.10) \lambda(q_1, q_2) \ll \tau(q_1 q_2).$$

From (4.9), (4.10) and the inequalities

$$\tau(q_1q_2) \ll (q_1q_2)^{\varepsilon} \ll X^{\varepsilon}$$

it follows

(4.11)
$$\Sigma(X, q_1, q_2) = X \frac{\lambda(q_1, q_2)}{q_1 q_2} + \mathcal{O}(X^{\varepsilon}).$$

Bearing in mind (4.2), (4.5) and (4.11) we obtain

(4.12)
$$\Gamma_{1}(X) = X \sum_{\substack{d_{1}d_{2} \leqslant z \\ (d_{1},d_{2})=1}} \frac{\mu(d_{1})\mu(d_{2})\lambda(d_{1}^{2},d_{2}^{2})}{d_{1}^{2}d_{2}^{2}} + \mathcal{O}(zX^{\varepsilon})$$

$$= \sigma X - X \sum_{\substack{d_{1}d_{2} > z \\ (d_{1},d_{2})=1}} \frac{\mu(d_{1})\mu(d_{2})\lambda(d_{1}^{2},d_{2}^{2})}{d_{1}^{2}d_{2}^{2}} + \mathcal{O}(zX^{\varepsilon}),$$

where

(4.13)
$$\sigma = \sum_{\substack{d_1, d_2 = 1 \\ (d_1, d_2) = 1}}^{\infty} \frac{\mu(d_1)\mu(d_2)\lambda(d_1^2, d_2^2)}{d_1^2 d_2^2}.$$

Using (4.10) we find

$$(4.14) \qquad \sum_{\substack{d_1d_2 > z \\ (d_1,d_2) = 1}} \frac{\mu(d_1)\mu(d_2)\lambda(d_1^2,d_2^2)}{d_1^2d_2^2} \ll \sum_{\substack{d_1d_2 > z \\ (d_1,d_2) = 1}} \frac{(d_1d_2)^{\varepsilon}}{(d_1d_2)^2} \ll \sum_{n>z} \frac{\tau(n)}{n^{2-\varepsilon}} \ll z^{\varepsilon-1}.$$

It remains to see that product (2.6) and sum (4.13) coincide. From definition (2.4) it follows that the function $\lambda(q_1, q_2)$ is multiplicative, i.e. if

$$(q_1q_2, q_3q_4) = (q_1, q_2) = (q_3, q_4) = 1,$$

then

(4.15)
$$\lambda(q_1q_2, q_3q_4) = \lambda(q_1, q_3)\lambda(q_2, q_4).$$

The proof is elementary and we leave it to the reader.

From property (4.15) and $(d_1, d_2) = 1$ it follows

$$\lambda(d_1^2,d_2^2) = \lambda(d_1^2,1)\lambda(1,d_2^2).$$

Bearing in mind (4.13) and (4.16) we get

(4.17)
$$\sigma = \sum_{d_1=1}^{\infty} \frac{\mu(d_1)\lambda(d_1^2, 1)}{d_1^2} \sum_{d_2=1}^{\infty} \frac{\mu(d_2)\lambda(1, d_2^2)}{d_2^2} f_{d_1}(d_2),$$

where

$$f_{d_1}(d_2) = \begin{cases} 1 & \text{if } (d_1, d_2) = 1, \\ 0 & \text{if } (d_1, d_2) > 1. \end{cases}$$

Clearly the function

$$\frac{\mu(d_2)\lambda(1,d_2^2)}{d_2^2}f_{d_1}(d_2)$$

is multiplicative with respect to d_2 and the series

$$\sum_{d_2=1}^{\infty} \frac{\mu(d_2)\lambda(1,d_2^2)}{d_2^2} f_{d_1}(d_2)$$

is absolutely convergent.

1000

Applying the Euler product we obtain

(4.18)
$$\sum_{d_2=1}^{\infty} \frac{\mu(d_2)\lambda(1, d_2^2)}{d_2^2} f_{d_1}(d_2) = \prod_{p \nmid d_1} \left(1 - \frac{\lambda(1, p^2)}{p^2}\right)$$
$$= \prod_{p} \left(1 - \frac{\lambda(1, p^2)}{p^2}\right) \prod_{p \mid d_1} \left(1 - \frac{\lambda(1, p^2)}{p^2}\right)^{-1}.$$

From (4.17) and (4.18) it follows

(4.19)
$$\sigma = \sum_{d_1=1}^{\infty} \frac{\mu(d_1)\lambda(d_1^2, 1)}{d_1^2} \prod_{p} \left(1 - \frac{\lambda(1, p^2)}{p^2}\right) \prod_{p|d_1} \left(1 - \frac{\lambda(1, p^2)}{p^2}\right)^{-1}$$
$$= \prod_{p} \left(1 - \frac{\lambda(1, p^2)}{p^2}\right) \sum_{d_1=1}^{\infty} \frac{\mu(d_1)\lambda(d_1^2, 1)}{d_1^2} \prod_{p|d_1} \left(1 - \frac{\lambda(1, p^2)}{p^2}\right)^{-1}.$$

Obviously the function

$$\frac{\mu(d_1)\lambda(d_1^2,1)}{d_1^2} \prod_{p|d_1} \left(1 - \frac{\lambda(1,p^2)}{p^2}\right)^{-1}$$

is multiplicative with respect to d_1 and the series

$$\sum_{d_1=1}^{\infty} \frac{\mu(d_1)\lambda(d_1^2, 1)}{d_1^2} \prod_{p|d_1} \left(1 - \frac{\lambda(1, p^2)}{p^2}\right)^{-1}$$

is absolutely convergent.

Applying again the Euler product from (2.4) and (4.19) we find

(4.20)
$$\sigma = \prod_{p} \left(1 - \frac{\lambda(1, p^2)}{p^2} \right) \prod_{p} \left(1 - \frac{\lambda(p^2, 1)}{p^2} \left(1 - \frac{\lambda(1, p^2)}{p^2} \right)^{-1} \right)$$
$$= \prod_{p} \left(1 - \frac{\lambda(p^2, 1) + \lambda(1, p^2)}{p^2} \right) = \prod_{p>2} \left(1 - \frac{(-1/p) + (-2/p) + 2}{p^2} \right).$$

Bearing in mind (4.5), (4.12), (4.14) and (4.20) we get

(4.21)
$$\Gamma_1(X) = \sigma X + \mathcal{O}(zX^{\varepsilon}),$$

where σ is given by product (2.6).

4.2. Estimation of $\Gamma_2(X)$. Using (4.3), (4.4) and splitting the range of d_1 and d_2 into dyadic subintervals of the form $D_1 \leq d_1 < 2D_1$, $D_2 \leq d_2 < 2D_2$ we write

(4.22)
$$\Gamma_2(X) \ll (\log X)^2 \sum_{n \leqslant X} \sum_{\substack{D_1 \leqslant d_1 < 2D_1 \ D_2 \leqslant d_2 < 2D_2 \\ n^2 + 1 \equiv 0(d_1^2) \ n^2 + 2 \equiv 0(d_2^2)}} 1,$$

where

(4.23)
$$\frac{1}{2} \leqslant D_1, \quad D_2 \leqslant \sqrt{X^2 + 2}, \quad D_1 D_2 > \frac{z}{4}.$$

On the one hand, (4.22) gives us

$$(4.24) \Gamma_2(X) \ll X^{\varepsilon} \Sigma_1,$$

where

(4.25)
$$\Sigma_1 = \sum_{n \leqslant X} \sum_{\substack{D_1 \leqslant d_1 < 2D_1 \\ n^2 + 1 = 0(d_1^2)}} 1.$$

On the other hand, (4.22) implies

$$(4.26) \Gamma_2(X) \ll X^{\varepsilon} \Sigma_2,$$

where

(4.27)
$$\Sigma_2 = \sum_{\substack{n \leqslant X \ D_2 \leqslant d_2 < 2D_2 \\ n^2 + 2 \equiv 0(d_2^2)}} 1.$$

Estimation of Σ_1 . Define

$$(4.28) \mathcal{N}_1(d) = \{ n \in \mathbb{N} : 1 \le n \le d, n^2 + 1 \equiv 0(d) \},$$

(4.29)
$$\mathcal{N}'_1(d) = \{ n \in \mathbb{N} \colon 1 \leqslant n \leqslant d^2, \, n^2 + 1 \equiv 0(d^2) \}.$$

By (4.25) and (4.29) we obtain

(4.30)
$$\Sigma_{1} = \sum_{D_{1} \leqslant d_{1} < 2D_{1}} \sum_{n \in \mathcal{N}'_{1}(d_{1})} \sum_{\substack{m \leqslant X \\ m \equiv n(d_{1}^{2})}} 1$$

$$= \sum_{D_{1} \leqslant d_{1} < 2D_{1}} \sum_{n \in \mathcal{N}'_{1}(d_{1})} \left(\left[\frac{X - n}{d_{1}^{2}} \right] - \left[\frac{-n}{d_{1}^{2}} \right] \right)$$

$$= \sum_{D_{1} \leqslant d_{1} < 2D_{1}} \sum_{n \in \mathcal{N}'_{1}(d_{1})} \left(\frac{X}{d_{1}^{2}} + \psi\left(\frac{-n}{d_{1}^{2}}\right) - \psi\left(\frac{X - n}{d_{1}^{2}}\right) \right)$$

$$\ll X^{1+\varepsilon} D_{1}^{-1} + |\Sigma'_{1}| + |\Sigma''_{1}|,$$

where

(4.31)
$$\Sigma_1' = \sum_{D_1 \leq d_1 \leq 2D_1} \sum_{n \in \mathcal{N}'(d_1)} \psi\left(\frac{-n}{d_1^2}\right),$$

(4.32)
$$\Sigma_1'' = \sum_{D_1 \leq d_1 < 2D_1} \sum_{n \in \mathcal{N}_1'(d_1)} \psi\left(\frac{X - n}{d_1^2}\right)$$

and $\psi(t)$ is defined by (1.1).

Firstly, we consider the sum Σ' . We note that the sum over n in (4.31) does not contain terms with $n = \frac{1}{2}d_1^2$ and $n = d_1^2$. Moreover, for any n satisfying the congruences $n^2 + 1 \equiv 0(d_1^2)$ and such that $1 \leq n < \frac{1}{2}d_1^2$, the number $d_1^2 - n$ satisfies the same congruence and we have,

$$\psi\left(\frac{-n}{d_1^2}\right) + \psi\left(\frac{-(d_1^2 - n)}{d_1^2}\right) = 0.$$

Bearing in mind these arguments for the sum Σ' denoted by (4.31) we have that

$$(4.33) \Sigma' = 0.$$

Next, we consider the sum Σ'' denoted by (4.32). Let $D_1 \leqslant X^{1/2}$. The trivial estimation gives us

$$(4.34) \Sigma_1'' \ll \sum_{D_1 \leqslant d_1 \leqslant 2D_1} d_1^{\varepsilon} \ll X^{1/2+\varepsilon}.$$

Let

$$(4.35) D_1 > X^{1/2}.$$

From the theory of the quadratic congruences we know that when $\#\mathcal{N}'_1(d) \neq 0$, then d is odd and

(4.36)
$$\#\mathcal{N}_1(d) = \#\mathcal{N}_1'(d) = 2^{\omega(d)}.$$

Denote

$$(4.37) k = 2^{\omega(d)},$$

(4.38)
$$n_1, \ldots, n_k \in \mathcal{N}_1(d), \quad n'_1, \ldots, n'_k \in \mathcal{N}'_1(d).$$

From (4.28), (4.29), (4.35)–(4.38) and $d \ge D_1 > X^{1/2}$ it follows

$$(4.39) \qquad \sum_{n \in \mathcal{N}'_{1}(d_{1})} \psi\left(\frac{X-n}{d_{1}^{2}}\right) = \sum_{n \in \mathcal{N}'_{1}(d_{1})} \left(\frac{X-n}{d_{1}^{2}} - \frac{1}{2}\right)$$

$$= \sum_{n \in \mathcal{N}'_{1}(d_{1})} \left(\frac{X}{d_{1}^{2}} - \frac{1}{2}\right) - \frac{n'_{1} + \dots + n'_{k/2} + (d_{1}^{2} - n'_{1}) + \dots + (d_{1}^{2} - n'_{k/2})}{d_{1}^{2}}$$

$$= \sum_{n \in \mathcal{N}_{1}(d_{1})} \left(\frac{X}{d_{1}^{2}} - \frac{1}{2}\right) - \frac{n_{1} + \dots + n_{k/2} + (d_{1} - n_{1}) + \dots + (d_{1} - n_{k/2})}{d_{1}}$$

$$= \sum_{n \in \mathcal{N}_{1}(d_{1})} \left(\frac{X}{d_{1}^{2}} - \frac{1}{2}\right) - \sum_{n \in \mathcal{N}_{1}(d_{1})} \frac{n}{d_{1}}$$

$$= \sum_{n \in \mathcal{N}_{1}(d_{1})} \left(\frac{X}{d_{1}^{2}} - \frac{\sqrt{X}}{d_{1}}\right) + \sum_{n \in \mathcal{N}_{1}(d_{1})} \left(\frac{\sqrt{X} - n}{d_{1}} - \frac{1}{2}\right)$$

$$= \sum_{n \in \mathcal{N}_{1}(d_{1})} \left(\frac{X}{d_{1}^{2}} - \frac{\sqrt{X}}{d_{1}}\right) + \sum_{n \in \mathcal{N}_{1}(d_{1})} \psi\left(\frac{\sqrt{X} - n}{d_{1}}\right).$$

By (4.32), (4.35) and (4.39) we obtain

$$(4.40) \Sigma_1'' \ll X^{1/2+\varepsilon} + |\Sigma_3|,$$

where

(4.41)
$$\Sigma_3 = \sum_{D_1 \le d_1 \le 2D_1} \sum_{n \in \mathcal{N}_1(d_1)} \psi\left(\frac{\sqrt{X} - n}{d_1}\right).$$

Using (4.41) and Lemma 3.1 with

$$(4.42) M_1 = X^{1/2}$$

we find

$$\Sigma_{3} = \sum_{D_{1} \leqslant d_{1} < 2D_{1}} \sum_{n \in \mathcal{N}_{1}(d_{1})} \left(-\sum_{1 \leqslant |m| \leqslant M_{1}} \frac{e(m(\sqrt{X} - n)/d_{1})}{2\pi i m} + \mathcal{O}\left(f_{M_{1}}\left(\frac{\sqrt{X} - n}{d_{1}}\right)\right) \right).$$

Arguing as in [12], Theorem 17.1.1 we deduce

$$(4.43) \Sigma_3 \ll X^{\varepsilon} (D_1 M_1^{-1} + D_1^{3/4} + X^{1/2} M_1 D_1^{-1/4}).$$

Bearing in mind (4.30), (4.33), (4.34), (4.40), (4.42) and (4.43) we get

$$(4.44) \Sigma_1 \ll X^{1+\varepsilon} D_1^{-1/4}.$$

Estimation of Σ_2 . Our argument is a modification of Tolev (see [12], Theorem 17.1.1) argument.

Define

(4.45)
$$\mathcal{N}_2(d) = \{ n \in \mathbb{N} : 1 \leqslant n \leqslant d, \, n^2 + 2 \equiv 0(d) \}.$$

Working as in Σ_1 , from (4.27) and (4.45) we find

$$(4.46) \Sigma_2 \ll X^{1+\varepsilon} D_2^{-1}$$

for $D_2 \leqslant X^{1/2}$ and

$$(4.47) \Sigma_2 \ll X^{1/2+\varepsilon} + |\Sigma_4|$$

for

$$(4.48) D_2 > X^{1/2}.$$

where

(4.49)
$$\Sigma_4 = \sum_{D_2 \leq d_2 < 2D_2} \sum_{n \in \mathcal{N}_2(d_2)} \psi\left(\frac{\sqrt{X} - n}{d_2}\right).$$

From (4.49) and Lemma 3.1 with

$$(4.50) M_2 = X^{1/2}$$

we obtain

(4.51)

$$\Sigma_{4} = \sum_{D_{2} \leqslant d_{2} < 2D_{2}} \sum_{n \in \mathcal{N}_{2}(d_{2})} \left(-\sum_{1 \leqslant |m| \leqslant M_{2}} \frac{e(m((\sqrt{X} - n)/d_{2}))}{2\pi \mathrm{i}m} + \mathcal{O}\left(f_{M_{2}}\left(\frac{\sqrt{X} - n}{d_{2}}\right)\right) \right)$$

$$= \Sigma_{5} + \Sigma_{6},$$

where

(4.52)
$$\Sigma_5 = \sum_{1 \le |m| \le M_2} \frac{\Theta_m}{2\pi i m},$$

(4.53)
$$\Theta_m = \sum_{D_2 \leqslant d_2 < 2D_2} e\left(\frac{\sqrt{X}m}{d_2}\right) \sum_{n \in \mathcal{N}_2(d_2)} e\left(-\frac{nm}{d_2}\right),$$

(4.54)
$$\Sigma_6 = \sum_{D_2 \leqslant d_2 < 2D_2} \sum_{n \in \mathcal{N}_2(d_2)} f_{M_2} \left(\frac{\sqrt{X} - n}{d_2} \right).$$

By (4.53), (4.54) and Lemma 3.1 it follows

$$(4.55) \Sigma_{6} = \sum_{D_{2} \leqslant d_{2} < 2D_{2}} \sum_{n \in \mathcal{N}_{2}(d_{2})} \sum_{m = -\infty}^{\infty} b_{M_{2}}(m) e\left(\frac{\sqrt{X} - n}{d_{2}}m\right)$$

$$= \sum_{m = -\infty}^{\infty} b_{M_{2}}(m) \Theta_{m}$$

$$\ll \frac{\log M_{2}}{M_{2}} |\Theta_{0}| + \frac{\log M_{2}}{M_{2}} \sum_{1 \leqslant |m| \leqslant M_{2}^{1+\varepsilon}} |\Theta_{m}| + \sum_{|m| > M_{2}^{1+\varepsilon}} |b_{M_{2}}(m)| |\Theta_{m}|$$

$$\ll \frac{\log M_{2}}{M_{2}} D_{2}^{1+\varepsilon} + \frac{\log M_{2}}{M_{2}} \sum_{1 \leqslant m \leqslant M_{2}^{1+\varepsilon}} |\Theta_{m}| + D_{2}^{1+\varepsilon} \sum_{|m| > M_{2}^{1+\varepsilon}} |b_{M_{2}}(m)|$$

$$\ll \frac{\log M_{2}}{M_{2}} D_{2}^{1+\varepsilon} + \frac{\log M_{2}}{M_{2}} \sum_{1 \leqslant m \leqslant M_{2}^{1+\varepsilon}} |\Theta_{m}|.$$

Using (4.51), (4.52) and (4.55) we get

(4.56)
$$\Sigma_4 \ll X^{\varepsilon} \left(\frac{D_2}{M_2} + \sum_{1 \le m \le M_o^{1+\varepsilon}} \frac{|\Theta_m|}{m} \right).$$

Define

$$\mathcal{F}(d) = \{(u, v) \colon u^2 + 2v^2 = d, \ (u, v) = 1, \ u \in \mathbb{N}, \ v \in \mathbb{Z} \setminus \{0\}\}.$$

According to Lemma 3.4 there exists a surjection

$$\beta \colon \mathcal{F}(d) \to \mathcal{N}_2(d)$$

from $\mathcal{F}(d)$ to $\mathcal{N}_2(d)$ defined by (4.45) that associates to each couple $(u,v) \in \mathcal{F}(d)$ the element $n \in \mathcal{N}_2(d)$ satisfying

$$(4.58) nv \equiv u(d).$$

Consequently, there exists a subset $\mathcal{F}_0(d) \subset \mathcal{F}(d)$ such that the restriction

$$\beta|_{\mathcal{F}_0(d)}\colon \mathcal{F}_0(d) \to \mathcal{N}_2(d)$$

of β to $\mathcal{F}_0(d)$ is bijection.

Let $\beta|_{\mathcal{F}_0(d)}(u,v) = n_{u,v}$. Now (4.58) gives us

$$n_{u,v} \equiv u \overline{v}_d(d)$$

and therefore

(4.59)
$$\frac{n_{u,v}}{d} \equiv u \frac{\overline{v}_{u^2 + 2v^2}}{u^2 + 2v^2} (1).$$

Bearing in mind (4.59) and Lemma 3.2 we deduce

(4.60)
$$\frac{n_{u,v}}{d} \equiv \frac{u}{v(u^2 + 2v^2)} - \frac{\bar{u}_{|v|}}{v}(1),$$

(4.61)
$$\frac{n_{u,v}}{d} \equiv -\frac{2v}{u(u^2 + 2v^2)} + \frac{\overline{v}_u}{u}(1).$$

From (4.53), (4.60) and (4.61) we find

$$(4.62) \qquad \Theta_{m} = \sum_{D_{2} \leqslant d_{2} < 2D_{2}} e\left(\frac{m\sqrt{X}}{d_{2}}\right) \sum_{\substack{(u,v) \in \mathcal{F}_{0}(d_{2}) \\ 0 < u < |v|}} e\left(-\frac{n_{u,v}}{d_{2}}m\right)$$

$$= \sum_{D_{2} \leqslant d_{2} < 2D_{2}} e\left(\frac{m\sqrt{X}}{d_{2}}\right) \sum_{\substack{(u,v) \in \mathcal{F}_{0}(d_{2}) \\ 0 < u < |v|}} e\left(-\frac{mu}{v(u^{2} + 2v^{2})} + \frac{m\bar{u}_{|v|}}{v}\right)$$

$$+ \sum_{D_{2} \leqslant d_{2} < 2D_{2}} e\left(\frac{m\sqrt{X}}{d_{2}}\right) \sum_{\substack{(u,v) \in \mathcal{F}_{0}(d_{2}) \\ 0 < |v| < u}} e\left(\frac{2mv}{u(u^{2} + 2v^{2})} - \frac{m\bar{v}_{u}}{u}\right)$$

$$= \sum_{D_{2} \leqslant u^{2} + 2v^{2} < 2D_{2}} e\left(\frac{m\sqrt{X}}{u^{2} + 2v^{2}} - \frac{mu}{v(u^{2} + 2v^{2})} + \frac{m\bar{u}_{|v|}}{v}\right)$$

$$+ \sum_{D_{2} \leqslant u^{2} + 2v^{2} < 2D_{2}} e\left(\frac{m\sqrt{X}}{u^{2} + 2v^{2}} + \frac{2mv}{u(u^{2} + 2v^{2})} - \frac{m\bar{v}_{u}}{u}\right)$$

$$= \Theta'_{m} + \Theta''_{m}.$$

Let us consider Θ'_m . Denote

(4.63)
$$f(u) = e\left(\frac{m\sqrt{X}}{u^2 + 2v^2} - \frac{mu}{v(u^2 + 2v^2)}\right),$$

(4.64)
$$\eta_1(v) = \sqrt{\max(0, D_2 - 2v^2)}, \quad \eta_2(v) = \sqrt{\min(v^2, 2D_2 - 2v^2)},$$

$$(4.65) K_{v,m}(t) = \sum_{\substack{\eta_1(v) \leqslant u \leqslant t \\ (u,v)=1}} e\left(\frac{m\bar{u}_{|v|}}{v}\right).$$

Using (4.62)–(4.65) and Abel's summation formula we obtain

$$(4.66) \quad \Theta'_{m} = \sum_{\sqrt{D_{2}/3} \leqslant |v| < \sqrt{D_{2}}} \sum_{\substack{\eta_{1}(v) \leqslant u \leqslant \eta_{2}(v) \\ (u,v) = 1}} f(u)e\left(\frac{mu_{|v|}}{v}\right)$$

$$= \sum_{\sqrt{D_{2}/3} \leqslant |v| < \sqrt{D_{2}}} \left(f(\eta_{2}(v))K_{v,m}(\eta_{2}(v)) - \int_{\eta_{1}(v)}^{\eta_{2}(v)} K_{v,m}(t)\left(\frac{\mathrm{d}}{\mathrm{d}t}f(t)\right)\mathrm{d}t\right)$$

$$\ll \sum_{\sqrt{D_{2}/3} \leqslant |v| < \sqrt{D_{2}}} \left(1 + \frac{m\sqrt{X}}{v^{2}}\right) \max_{\eta_{1}(v) \leqslant t \leqslant \eta_{2}(v)} |K_{v,m}(t)|.$$

We are now in a good position to apply Lemma 3.3 because the sum defined by (4.65) is incomplete Kloosterman sum. Thus,

(4.67)
$$K_{v,m}(t) \ll |v|^{1/2+\varepsilon} (v,m)^{1/2}.$$

By (4.66) and (4.67) we get

(4.68)
$$\Theta'_{m} \ll \sum_{\sqrt{D_{2}/3} \leqslant |v| < \sqrt{D_{2}}} \left(1 + \frac{m\sqrt{X}}{v^{2}} \right) |v|^{1/2 + \varepsilon} (v, m)^{1/2}$$
$$\ll X^{\varepsilon} (D_{2}^{1/4} + mX^{1/2}D_{2}^{-3/4}) \sum_{0 < v < \sqrt{D_{2}}} (v, m)^{1/2}.$$

On the other hand,

(4.69)
$$\sum_{0 < v < \sqrt{D_2}} (v, m)^{1/2} \leqslant \sum_{l \mid m} l^{1/2} \sum_{\substack{v \leqslant \sqrt{D_2} \\ v \equiv 0(l)}} 1$$

$$\ll D_2^{1/2} \sum_{l \mid m} l^{-1/2} \ll D_2^{1/2} \tau(m) \ll X^{\varepsilon} D_2^{1/2}.$$

Estimations (4.68) and (4.69) imply

(4.70)
$$\Theta_m' \ll X^{\varepsilon} (D_2^{3/4} + mX^{1/2}D_2^{-1/4}).$$

Proceeding in a similar way for Θ''_m from (4.62) we deduce

(4.71)
$$\Theta_m'' \ll X^{\varepsilon} (D_2^{3/4} + mX^{1/2}D_2^{-1/4}).$$

Now (4.62), (4.70) and (4.71) give us

(4.72)
$$\Theta_m \ll X^{\varepsilon} (D_2^{3/4} + mX^{1/2}D_2^{-1/4}).$$

1008

From (4.56) and (4.72) it follows

(4.73)
$$\Sigma_4 \ll X^{\varepsilon} (D_2 M_2^{-1} + D_2^{3/4} + X^{1/2} M_2 D_2^{-1/4}).$$

Taking into account (4.50) and (4.73) we find

(4.74)
$$\Sigma_4 \ll X^{1+\varepsilon} D_2^{-1/4}.$$

Using (4.46), (4.47) and (4.74) we obtain

$$(4.75) \Sigma_2 \ll X^{1+\varepsilon} D_2^{-1/4}.$$

Estimation of $\Gamma_2(X)$. Summarizing (4.23), (4.24), (4.26), (4.44) and (4.75) we get

$$(4.76) \Gamma_2(X) \ll X^{1+\varepsilon} z^{-1/8}.$$

4.3. The end of the proof. Bearing in mind (4.1), (4.21), (4.76) and choosing $z = X^{8/9}$ we establish the asymptotic formula (2.5).

The theorem is proved.
