## ON A CLOSED RANGE THEOREM FOR NONLINEAR OPERATORS

S. SWAMINATHAN

Halifax

Let  $X$  and  $Y$  be Banach spaces,  $T$  a bounded linear operator from  $X$  to  $Y$  and  $T^*$  its conjugate from  $Y^*$  to  $X^*$ . It can be shown that the range of  $T$  is closed if and only if it is the set of all  $y$  in  $Y$  for which  $\langle y, y^* \rangle = 0$  for  $y^*$  in  $\ker T^*$ . The operator  $T$  is called normally solvable if, for  $y$  in  $Y$ , the equation  $Tx = y$  has a solution if and only if  $y \in (\ker T^*)^\perp$ . Then the closed range theorem is equivalent to the statement that the operator  $T$  is normally solvable if and only if  $T(X)$  is closed in  $Y$ .

When  $T$  is nonlinear and Fréchet differentiable it is possible to obtain closed range theorems by defining normal solvability of  $T$  for suitably restricted  $X$  and  $Y$ . In [3] S. I. Pohožaev considers a uniformly convex  $Y$  and defines  $T$  to be normally solvable when

(i) for any  $y$  in  $Y$ , there is a sequence  $\{y_n\}$  such that  $y_n \rightarrow y$  and for every  $y_n$  there exists  $x_n \in X$  minimizing the functional  $\|Tx - y_n\|$ , and

(ii) for any such sequence  $\{y_n\}$  if  $T(x_n) - y_n \in [\ker T'(x_n)^*]^\perp$  then  $y \in T(X)$ .

His result can be stated in the following form: Let  $X$  be a Banach space and  $Y$  a Banach space which admits nearest points, i.e., for each closed set  $M$  in  $Y$ , the set of all  $x$  in  $Y$ , for which there is a  $y$  in  $M$  with  $\|x - y\| = d(x, M)$ , is dense in  $Y$ . Let  $T$  be a possibly nonlinear Fréchet differentiable operator from  $X$  to  $Y$ . The operator  $T$  is normally solvable if and only if the range  $T(X)$  is closed in  $Y$ .

D. E. Wulbert [4] has shown that, besides uniformly convex Banach spaces, the following two classes of Banach spaces admit nearest points: (a) 2R Banach spaces or 2-fully convex Banach spaces of Ky Fan and I. Glicksberg [see 2, p. 113].  $X$  is defined to be such a space when if  $\{x_n\}$  is a sequence in  $X$  such that  $\|x_n\| = 1$  for every  $n$ , and  $\|x_m + x_n\| \rightarrow 2$  as  $m, n \rightarrow \infty$ , then  $\{x_n\}$  is a Cauchy sequence. (b) Uniformly smooth [see 2, p. 113] Banach spaces satisfying the property that if a sequence  $\{x_n\}$  converges weakly to  $x$  and if  $\|x_n\| \rightarrow \|x\|$ , then  $x_n$  converges strongly to  $x$ . Since there exist 2R Banach spaces which are not isomorphic to a uniformly convex space we have a positive answer to the question raised by S. I. Pohožaev in [3]. It should be pointed out that F. E. Browder [1] has formulated the underlying theory in a very elegant setting by considerably sharpening and generalizing the result to  $X$  a locally convex space and  $Y$  any Banach space.
