**SOLUTION OF NONLINEAR DEGENERATE  
ELLIPTIC-PARABOLIC SYSTEMS  
IN ORLICZ - SOBOLEV SPACES**

KAČUR J., BRATISLAVA, Czechoslovakia

We consider the system

$$(1.1) \quad \partial_t b^j(u) - \nabla a^j(t, x, b(u), \nabla u) = f^j(t, x, b(u)) \quad , \quad j = 1, \dots, m ;$$

$(x, t) \in Q_T = \Omega \times (0, T)$ ,  $\Omega \subset \mathbb{R}^N$  is bounded with the initial and boundary conditions

$$(1.2) \quad b(u) = b(u_0) \quad \Omega \times \{0\}$$

$$u = u^D \quad \text{on} \quad \Gamma_1 \times (0, T)$$

$$(1.3) \quad a(t, x, b(u)) \cdot \nu = \varphi(t, x, u) \quad \text{on} \quad \Gamma_2 \times (0, T)$$

where  $u = (u^1, \dots, u^m)$ ,  $\Gamma_1, \Gamma_2 \subset \partial\Omega$ ,  $\Gamma_1 \cap \Gamma_2 = \emptyset$   
 $\text{mes}_{N-1} \Gamma_1 + \text{mes}_{N-1} \Gamma_2 = \text{mes}_{N-1} \partial\Omega$ ,  $\text{mes}_{N-1} \Gamma_1 > 0$ .

We assume

$$(1.4) \quad b(u) = \nabla \Phi(u) \quad \text{where} \quad \Phi : \mathbb{R}^m \rightarrow \mathbb{R}^1 \text{ is convex, } C^1 \text{ and } b(0) = 0 .$$

On subsets where  $b$  is constant (1.1) is elliptic. System (1.1) includes porous medium type equations. This system has been studied by H.W. Alt and S. Luckhaus in [1] under the assumptions

$$(1.5) \quad (a(b(\eta), \xi_1) - a(b(\eta), \xi_2), \xi_1 - \xi_2) \geq c_0 |\xi_1 - \xi_2|^p \quad (p \geq 2) ,$$

$\varphi \equiv 0$  in (1.3) and under the corresponding polynomial growth conditions concerning  $a, f$ .

Our contribution is to prove the **existence** of the variational solution of (1.1) only for monotone ease  $c_0 = 0$  and under the very weak restrictions on the growth of  $a$  in  $\xi$ . Formally we can write it in the form

(1.6)  $a(b(\eta), \xi)$  is monotone in  $\xi$  (i.e. (1.5) holds with  $c_0 = 0$ ) and it is continuous in their variables;

(1.7)  $|a(b(\eta), \xi)| \leq c(1 + h(\eta) + |g(\xi)|)$

(1.8)  $a(b(\eta), \xi) \cdot \xi \geq c \xi \cdot g(\xi)$

(1.9)  $g \in C(\mathbb{R})$ ,  $g(\xi) \rightarrow \infty$  for  $|\xi| \rightarrow \infty$ ,  $\xi \cdot g(\xi)$  is even and convex for  $|\xi| \geq \xi_0 > 0$ . (In the fact we understand that to each component of  $\xi$  belongs a corresponding component of the vector function  $g$ ).

The growth conditions in a more general and more precise form are considered in [3].

Denote by  $G$ ,  $G(\xi) := \xi g(\xi)$  (for  $|\xi| \geq \xi_0 > 0$ ) the N-function (see [5]) and by  $\bar{G}$  the conjugate (N-function) with respect to  $G(\bar{G}(x) = \max_{y \in \mathbb{R}} (x \cdot y - G(y))$ ). By the same way we construct

(1.10)  $\Psi(x) := \overline{\phi(x) - \phi(0)}$  and  $B(\eta) := \Psi(b(\eta))$

Then  $h(\eta)$  in (1.7) has to satisfy

(1.11)  $h(\eta) \leq \bar{G}^{-1}(B(\eta))$

Moreover, we assume

(1.12)  $|f(b(\eta))| \leq c(1 + h(\eta))$

(1.13)  $u^D \in W_{\infty}^{1,1}(Q_T)$ ,  $u_0 := u^D(0)$ .

Our variational solution is an element of the Orlicz-Sobolev space  $V$  defined as follows.

Let  $L_G(Q_T) \equiv L_G$  be the Orlicz space

$$L_G \equiv \{u \in L_1(Q_T) : \exists k > 0 \text{ such that } \int_{Q_T} G(ku) < \infty\}$$

with the norm  $\|v\|_G = \inf\{r > 0 : \int_{Q_T} G(v/r) \leq 1\}$ .

$L_G$  is B-space and  $L_G \equiv (E_G^*)^*$  where  $E_G^*$  is the closure of bounded functions in the norm of the space  $L_G$ . When  $g(\xi) = |\xi|^{p-2} \xi$  then  $L_G \equiv L_p$  and  $L_G = L_q$  (with  $p^{-1} + q^{-1} = 1$ ). Then our Orlicz-Sobolev space  $V$  is defined as follows

$$V \equiv W_G^{1,0}(Q_T) = \{u : u^j \in L_{G_0^j} \text{ for } j = 1, \dots, m, D^i u^j \in L_{G_0^j}\}$$

for  $i = 1, \dots, N$  and  $u|_{\Gamma_1 \times (0,T)} = 0$

with the norm  $\|u\|_V = \sum_{j=1}^m \sum_{i=0}^N \|D^i u^j\|_{G_0^j}$  where we take  $G_0^j := \min_{1 \leq i \leq N} G_1^j$ . Evidently  $W_G^{1,0} \subset W_1^{1,0}(Q_T)$ . With respect to  $\varphi$  in (1.3) we assume

(1.14)  $\varphi(t,x,\eta)$  is continuous in their variables and is monotone in  $\eta$ ;

(1.15)  $|\varphi(\eta) \cdot \xi| \leq c_1 + c_2(\eta) \cdot \varphi(\eta) + \xi \cdot \varphi(\xi)$

(1.16)  $|\varphi^j(\eta)| \leq c(1 + \sum_{i=1}^m (\bar{G}_0^i)^{-1} [G_0^i(\eta^i)]) \quad \forall j = 1, \dots, m$ .

The more general conditions are considered in [4].

**1.17 Theorem** If (1.6) - (1.16) are satisfied then there exists a variational solution  $u$  of (1.1), i.e.,

$u - u^D \in V$ ,  $b(u) \in L_1(Q_T)$ ,  $a(b(u), \nabla u) \in L_G(Q_T)$ ,  $f(b(u)) \in L_G(Q_T)$  and

(1.18)  $\int_{Q_T} (b(u_0) - b(u)) \cdot \partial_t v + \int_{Q_T} a(b(u), \nabla u) \cdot \nabla v + \int_{S_T} \varphi(u) \cdot v = \int_{Q_T} f(b(u)) \cdot v$ ,  
 $\forall v \in V \cap L_\infty(Q_T)$  with  $\partial_t v \in L_\infty(Q_T)$ ,  $v(T) = 0$ .

**1.19 Remark** In the fact there exists  $\partial_t b(u) \in V^*$  and  $\int_{Q_T} (b(u_0) - b(u)) \cdot \partial_t v = \langle \partial_t b(u), v \rangle_T$  ( $\langle \cdot, \cdot \rangle_T$  is the duality between  $V^*$  and  $V$ ) where  $v$  is from (1.18). Then in the place of (1.18) we have

$$(1.18') \quad \langle \partial_t b(u), v \rangle_T + \int_{Q_T} a(b(u), \nabla u) \cdot \nabla v + \int_{S_T} \varphi(u) \cdot v = \int_{Q_T} f(b(u)) \cdot v \quad \forall v \in V.$$

To prove Theorem 1.17 we discretize (1.1) in time and space (modified time discretized Galerkin method). We obtain energy type a priori estimates

$$\int_{Q_T} G(\nabla u_\alpha) \leq c, \quad \sup_{t \in (0, T)} \int_{\Omega} B(u_\alpha(t)) \leq c \quad \text{and} \\ \int_0^{T-\tau} \int_{\Omega} (b(u_\alpha(t+\tau)) - b(u_\alpha(t))) \cdot (u_\alpha(t+\tau) - u_\alpha(t)) \leq c \tau$$

uniformly with respect to the discretization index  $\alpha$  ( $\alpha = (\Delta t, \lambda^{-1})$ ,  $\Delta t = \frac{T}{n}$ ,  $\lambda$  being the dimension of  $V_\lambda = \text{span}\{e_1, \dots, e_\lambda\}$ ). In the parabolic part of the equation we follow [1] (using compactness argument and integration by parts formula  $\int_0^T \int_{\Omega} \partial_t b(u_\alpha) \cdot u_\alpha = \sum_{\Omega} B(u_\alpha(t)) - \int_{\Omega} B(u_0)$ ). In the elliptic part of the equation we follow the idea of Minty-Browder. Some special properties of the Orlicz-Sobolev spaces are used and some results from elliptic equations [2] concerning Orlicz-Sobolev spaces are applied. The detail proofs are in [3] for  $\varphi \equiv 0$ . The case  $\varphi \neq 0$  and also nonmonotonicity of  $\varphi$  will be discussed in [4].

When the system (1.1) is diagonal we can prove  $L_\infty$ -boundedness of the variational solution. Moreover we can remove the restrictions of  $a, \varphi$  with respect to the growth in  $b(\eta)$ ,  $\eta$ , respectively. We consider

$$(2.1) \quad \partial_t b(u) - \nabla a(t, x, b(u), \nabla u) = \tilde{f}(t, x, b(u)) + \tilde{F}(t, x, b(u)) \\ \text{with (1.2), (1.3). We assume}$$

$$(2.2) \quad b(s) \text{ is strictly monotone and } |b(s)| \rightarrow \infty \text{ for } |s| \rightarrow \infty.$$

$$(2.3) \quad |a(b(\eta), \xi)| \leq \mu(|\eta|) (1 + |g(\xi)|), \quad a(b(\eta), 0) \equiv 0:$$

$$(2.4) \quad a(b(\eta), \xi) \cdot \xi \geq v(|\eta|) \xi \cdot g(\xi)$$

where  $v, \mu > 0$ , are continuous ( $v(s) \rightarrow 0$  for  $s \rightarrow \infty$ );

$$(2.5) \quad \partial_{\xi_i} a_k^j(b(\eta), \xi) = \partial_{\xi_k} a_i^j(b(\eta), \xi), \forall j, \forall i, k;$$

$$(2.6) \quad \partial_{\eta_i} \phi^j(\eta) \geq 0 \quad \text{and} \quad \phi^j(\eta) \cdot \eta^j \geq 0 \quad \forall |\eta| \geq K > 0 \quad \forall j;$$

$$(2.7) \quad |f(\eta)| \leq c_1(d + |\eta|), d \in L_\infty(Q_T)$$

and

$$(2.8) \quad \partial_{\eta_j} F^j(\eta) \leq 0, \forall j; \quad \sum_{j=1}^m \eta_j^p F^j(\eta) \leq c_2 |\eta|^{p+1} + c_3$$

$\forall p = 2k + 1, k \geq k_0 > 0, \forall |\eta| \leq D_T + 1$  where

$$(2.9) \quad D_T := (\|b(u^D)\|_{\infty, Q_T} + \|d\|_{\infty, Q_T} + b_K) e^{(c_1(m+1) + c_2)T}$$

$$\text{and} \quad b_K := \max_j (\max \{ b^j(K), -b^j(-K) \}).$$

**2.10 Theorem** Let (2.2) - (2.9), (1.6), (1.9) and (1.13) are satisfied. Then there exists a bounded variational solution of (2.1), (1.2), (1.3). Moreover  $\|b\{u\}\|_{\infty, Q_T} \leq D_T$  where  $D_T$  is from (2.9).

The assertion of Theorem 2.10 can be extended to the case when  $a$  is of the form  $a(t, x, M(u), \nabla u)$  with a rather general Volterra operator  $M: L_\infty(Q_T) \rightarrow L_\infty(Q_T)$ . The proof can be found in [3] for the case  $\varphi \equiv 0$ . The case  $\varphi \neq 0$  will be discussed in [4].
