ON THE LARGEST GENERALIZED JOINT SPECTRUM

V. MÜLLER and A. SOLTYSIAK

Abstract. An explicit description of the largest generalized joint spectrum on a Banach algebra is given. It is proved that this spectrum coincides with the rationally convex joint spectrum introduced by Waelbroeck. This answers questions posed in [4].

Key words: Banach algebra, generalized joint spectrum.

Classification: 46H05

Let A be a complex Banach algebra with the unit 1. By $\sigma^A(a)$, or simply $\sigma(a)$ if there is no confusion, we shall denote the usual spectrum of an element $a \in A$. A generalized joint spectrum on A is a function $\tilde{\sigma}$ which assigns to each finite collection $\{a_1, \dots, a_n\}$ of elements in A a compact subset of \mathbb{C}^n (possibly empty) in such a way that the following three conditions are satisfied:

$$(I) \quad \tilde{\sigma}(a_1, \dots, a_n) \subset \prod_{k=1}^n \sigma(a_k)$$

(For simplicity we write $\tilde{\sigma}(a_1, \dots, a_n)$ instead of $\tilde{\sigma}(\{a_1, \dots, a_n\})$;

$$(II) \quad p(\tilde{\sigma}(a_1, \dots, a_n)) \subset \tilde{\sigma}(p(a_1, \dots, a_n))$$

where p is an arbitrary m -tuple of polynomials over \mathbb{C} in n non-commutative indeterminates;

$$(III) \quad \tilde{\sigma}(a_1, \dots, a_n) \neq \emptyset \text{ whenever elements } a_1, \dots, a_n \text{ are pairwise commuting,}$$

The above definition was given in [4]. It was shown that there exists the largest generalized joint spectrum (with respect to the following obvious partial order: $\tilde{\sigma}_1 \leq \tilde{\sigma}_2$ if and only if $\tilde{\sigma}_1(a_1, \dots, a_n) \subset \tilde{\sigma}_2(a_1, \dots, a_n)$ for all finite subsets $\{a_1, \dots, a_n\}$ of A).

It was asked if one can give a simple characterization of this spectrum.

The bicommutant joint spectrum was given as a candidate for the largest generalized joint spectrum.

The purpose of the present paper is to give a description of this largest spectrum. We prove that it coincides with the rationally convex joint spectrum introduced by Waelbroeck. We also show (see Example 2 below) that it differs from the bicommutant joint spectrum in general.

Following L. Waelbroeck (see [6] or [7]) we shall give

Definition. Let $a_1, \dots, a_n \in A$ (we do not assume them to commute). The rationally convex joint spectrum of the n -tuple (a_1, \dots, a_n) is the set

$$\overline{\sigma}(a_1, \dots, a_n) = \{(\lambda_1, \dots, \lambda_n) \in \mathbb{C}^n : p(\lambda_1, \dots, \lambda_n) \in \sigma(p(A_1, \dots, A_n)) \text{ for every } p \in P_n\}$$

where P_n denotes the set of all polynomials over \mathbb{C} in n non-commutative indeterminates.

Theorem. The largest generalized joint spectrum and the rationally convex joint spectrum coincide.

Proof. First we show that the rationally convex joint spectrum is a generalized joint spectrum, i.e. it satisfies conditions (I) - (III).

To see that (I) is fulfilled, take $p_j(x_1, \dots, x_n) = x_j$ ($j=1, \dots, n$). Then $(\lambda_1, \dots, \lambda_n) \in \overline{\sigma}(A_1, \dots, A_n)$ implies

$$\lambda_j = p_j(\lambda_1, \dots, \lambda_n) \in \sigma(p_j(A_1, \dots, A_n)) = \sigma(a_j)$$

which gives (I).

It is also clear that (II) holds true. If $(\mu_1, \dots, \mu_m) \in \rho(\overline{\sigma}(a_1, \dots, a_n))$ then $(\mu_1, \dots, \mu_m) = p(\lambda_1, \dots, \lambda_n)$ for some $(\lambda_1, \dots, \lambda_n) \in \overline{\sigma}(a_1, \dots, a_n)$. Taking an arbitrary $q \in P_m$ we get $q \circ p \in P_n$ and $(q \circ p)(\lambda_1, \dots, \lambda_n) \in \sigma((q \circ p)(a_1, \dots, a_n))$, i.e. $q(\mu_1, \dots, \mu_m) \in \sigma(q(p(a_1, \dots, a_n)))$ which means that $(\mu_1, \dots, \mu_m) \in \sigma(p(a_1, \dots, a_n))$.

Finally (III) is trivially satisfied since we always have $\sigma(a_1, \dots, a_n) \subset \overline{\sigma}(a_1, \dots, a_n)$ where $\sigma(a_1, \dots, a_n)$ denotes the Harte's spectrum (= the union of the left and the right joint spectra) of the n -tuple (a_1, \dots, a_n) .

Moreover we have $\overline{\sigma}(a_1, \dots, a_n) \subset \overline{\mathcal{G}}(a_1, \dots, a_n)$ for every generalized joint spectrum $\overline{\mathcal{G}}$ on A . Indeed, if $(\lambda_1, \dots, \lambda_n) \in \overline{\mathcal{G}}(a_1, \dots, a_n)$, then by (II) and (I) $p(\lambda_1, \dots, \lambda_n) \in \sigma(p(a_1, \dots, a_n)) \subset \sigma(p(a_1, \dots, a_n))$ for every $p \in P_n$.

Hence $(\lambda_1, \dots, \lambda_n) \in \overline{\sigma}(a_1, \dots, a_n)$ and we are done. So, $\overline{\sigma}$ is the largest generalized joint spectrum.

Let K be a compact subset of \mathbb{C}^n , ($1 \leq n < \infty$). Then the rationally convex hull \tilde{K} of K is defined (see [1] or [7]) as the set of all n -tuples $(\lambda_1, \dots, \lambda_n) \in \mathbb{C}^n$ such that $|f(\lambda_1, \dots, \lambda_n)| \leq \sup_{(z_1, \dots, z_n) \in K} |f(z_1, \dots, z_n)|$ for every rational function f analytic on the set K . Equivalently, $(\lambda_1, \dots, \lambda_n) \in \tilde{K}$ if and only if $p(\lambda_1, \dots, \lambda_n) \in p(K)$ for every polynomial $p \in P_n$. Next corollary shows that if a_1, \dots, a_n are pairwise commuting elements of a Banach algebra A then $\overline{\sigma}(a_1, \dots, a_n)$ is equal to the rationally convex hull of $\sigma(a_1, \dots, a_n)$. Example 1 below will show that this is not the case when a_1, \dots, a_n do not commute.

Corollary 1. Let a_1, \dots, a_n be pairwise commuting elements of a Banach algebra A . Then $\overline{\sigma}(a_1, \dots, a_n)$ is the rationally convex hull of the Harte's spectrum $\sigma(a_1, \dots, a_n)$.

Proof. If elements a_1, \dots, a_n are pairwise commuting then the Harte's spectrum has the spectral mapping property. In particular, $\sigma(p(a_1, \dots, a_n)) = p(\sigma(a_1, \dots, a_n))$ for all $p \in P_n$ (see [2]). This implies immediately that $\overline{\sigma}(a_1, \dots, a_n)$ is the rationally convex hull of the Harte's spectrum $\sigma(a_1, \dots, a_n)$.

Corollary 2. Let a_1, \dots, a_n be elements of a Banach algebra A . Then

$$\overline{\sigma}(a_1, \dots, a_n) \subset \overline{\sigma}(a_1, \dots, a_n) \subset \sigma^{[a_1, \dots, a_n]}(a_1, \dots, a_n)$$

where $\sigma^{[a_1, \dots, a_n]}(a_1, \dots, a_n)$ denotes the Harte's spectrum of the n -tuple (a_1, \dots, a_n) in the algebra $[a_1, \dots, a_n]$ generated by a_1, \dots, a_n and the unit.

Proof. Let $(\lambda_1, \dots, \lambda_n) \in \overline{\sigma}(a_1, \dots, a_n)$. Then

$$p(\lambda_1, \dots, \lambda_n) \in p(\overline{\sigma}(a_1, \dots, a_n)) \subset \sigma(p(a_1, \dots, a_n))$$

for every $p \in P_n$ (see [2]). Hence $(\lambda_1, \dots, \lambda_n) \in \overline{\sigma}(a_1, \dots, a_n)$ and the rationally convex hull of $\sigma(a_1, \dots, a_n)$ is contained in $\overline{\sigma}(a_1, \dots, a_n)$.

Property (II) implies that $\overline{\sigma}$ is translation invariant, i.e.

$(\lambda_1, \dots, \lambda_n) \in \overline{\sigma}(a_1, \dots, a_n)$ if and only if $(0, \dots, 0) \in \overline{\sigma}(a_1 - \lambda_1, \dots, a_n - \lambda_n)$. Therefore to prove the second inclusion it is sufficient to show that

$$(0, \dots, 0) \in \overline{\sigma}(a_1, \dots, a_n) \text{ implies } (0, \dots, 0) \in \sigma^{[a_1, \dots, a_n]}(a_1, \dots, a_n).$$

Suppose $(0, \dots, 0) \in \overline{\sigma}(a_1, \dots, a_n)$. Then $M = \{p(a_1, \dots, a_n) : p \in P_n, p(0, \dots, 0) = 0\}$ is a linear subspace of codimension 1 in the algebra $[a_1, \dots, a_n]$

consisting of singular elements in A (and thus singular in $[a_1, \dots, a_n]$). By the Gleason-Kahane-Żelazko theorem (see [8], p. 87) M is a maximal two-sided ideal in $[a_1, \dots, a_n]$ and $(0, \dots, 0) \in \mathfrak{S}^{[a_1, \dots, a_n]}(a_1, \dots, a_n)$.

Now we proceed to the previously mentioned examples.

Example 1 (cf. [5], Example 1). Let A be the algebra $M_5(\mathbb{C})$ of all 5×5 matrices with complex entries. Take the following two elements of A:

$$a_1 = \begin{pmatrix} 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 \end{pmatrix} \text{ and } a_2 = \begin{pmatrix} 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \end{pmatrix}$$

Then we have $a_1^3 = a_2^3 = 0$. Hence $\mathfrak{S}^A(a_1) = \mathfrak{S}^A(a_2) = \{0\}$. This implies $\mathfrak{S}^A(a_1, a_2) \subset \mathfrak{C}\{(0,0)\}$. Further $a_1 a_3 + a_2 a_1 = 1$ and $a_2 a_1 + a_4 a_2 = 1$ where

$$a_3 = \begin{pmatrix} 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \end{pmatrix} \text{ and } a_4 = \begin{pmatrix} 0 & 1 & 0 & 0 & -1 \\ 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 \end{pmatrix}$$

Hence $\mathfrak{S}^A(a_1, a_2) = \emptyset$. Let $B = [a_1, a_2]$.

If we assign to each element $b \in B$ the entry of b which is placed in the third row and the third column, then we shall get a linear functional φ on B. We prove that φ is multiplicative on B. By the Gleason-Kahane-Żelazko theorem it is sufficient to show that $\varphi(a_{i_1} a_{i_2} \dots a_{i_k}) = 0$ for all finite products of a_1 and a_2 i.e. for all $k \in \{1, 2, \dots\}$, $i_1, \dots, i_k \in \{1, 2\}$. This is clear if $a_{i_1} = a_2$ as the third row is then equal to zero. From the same reason

$\varphi(a_{i_1} \dots a_{i_k}) = 0$ if $a_{i_1} = a_1$, $a_{i_2} = a_2$. The rest follows from the relations

$\varphi(a_1^2) = \varphi(a_1^2 a_2) = 0$, $a_1^3 = a_1^2 a_2^2 = 0$ and $a_1^2 a_2 a_1 = a_1^2$ which can be checked directly.

Thus $(0,0) = (\varphi(a_1), \varphi(a_2)) \in \mathfrak{S}^B(a_1, a_2)$ and $p(0,0) = p(\varphi(a_1), \varphi(a_2)) =$

$= \varphi(p(a_1, a_2)) \in \mathfrak{S}^B(p(a_1, a_2))$ for every polynomial $p \in P_2$.

Further $\mathfrak{S}^B(p(a_1, a_2)) = \partial \mathfrak{S}^B(p(a_1, a_2)) \subset \mathfrak{S}^A(p(a_1, a_2))$ as $\dim B < \infty$.

Hence $(0,0) \in \overline{\mathfrak{S}}^A(a_1, a_2)$ and $\overline{\mathfrak{S}}^A(a_1, a_2)$ is not the rationally convex hull of $\mathfrak{S}^A(a_1, a_2) = \emptyset$.

Example 2. Let $K = \{(z_1, z_2) \in \mathbb{C}^2, |z_2| \leq |z_1| \leq 1\}$. Then K is compact but not rationally convex. Its rationally convex hull \tilde{K} is equal to

$$\tilde{K} = \{(z_1, z_2) \in \mathbb{C}^2, |z_1| \leq 1, |z_2| \leq 1\}$$

(see [1], p. 76).

Let $A = C(K)$ be the algebra of all continuous complex-valued functions on K . Then the bicommutant joint spectrum \mathfrak{S}'' (cf. [4]) coincides with the Harte's spectrum on this algebra. Put $\pi_1(z_1, z_2) = z_1$ and $\pi_2(z_1, z_2) = z_2$. Then

$$\overline{\mathfrak{S}}(\pi_1, \pi_2) = \overline{\mathfrak{S}(\pi_1, \pi_2)} = \tilde{K} \cap K = \mathfrak{S}(\pi_1, \pi_2) = \mathfrak{S}''(\pi_1, \pi_2).$$

Thus we see that the rationally convex joint spectrum is larger than the bicommutant spectrum.
