THREE-LINKING IN EULERIAN DIGRAPHS

T.Ibaraki(Kyoto University, Faculty of Engineering, Dept. of Applied Math. and Physics) S.Poljak (Charles University, Faculty of Mathematics and Physics, Dept. of Applied Math., received 30.12.1988)

Let G be an Eulerian digraph and a, b and c an ordered triple of its vertices. We say that an instance $(G; a, b, c)$ is feasible, if there are three edge disjoint paths P_{ab}, P_{bc} and P_{ca} , where P_{xy} denotes a directed path from x to y .

We say that an instance $(G; a, b, c)$ is minimal infeasible, if it is infeasible, and after contraction of any edge whose both ends are not simultaneously in $\{a, b, c\}$ we get a graph G' such that $(G'; a, b, c)$ is feasible.

Theorem 1. Let $(G; a, b, c)$ be a minimal infeasible instance. Then G has the following properties.

- (i) G is planar 2-connected. Vertices a, b and c have degree 2, and all other vertices have degree 4.
- (ii) Every face of G is a directed cycle, or equivalently, the edges incident to a vertex are alternatively oriented out and in.
- (iii) Vertices a, b and c lie on the outer face which goes through them in the order c, b and a .

Conversely, any instance $(G; a, b, c)$ satisfying (i), (ii) and (iii) is infeasible.

Theorem 2. There is a polynomial time algorithm to decide whether an instance $(G; a, b, c)$ is feasible or infeasible.
